2026 2nd International Conference on Sustainable Computing and Integrated Communication in Changing Landscape of AI (ICSCAI) | 979-8-3315-7150-4/26/$31.00 ©2026 IEEE | DOI: 10.1109/ICSCAI68849.2026.11648841

Using AI for Contract Analysis and Drafting: Efficiency and Accuracy in Legal Workflows

Dr. Eman Ibrahim Alwreikat
Assistant Professor, Private Law Department,
Faculty of Law, Al-Ahliyya Amman University,
Amman, Jordan
e.alwreikat@ammanu.edu.jo

Abstract - AI has found many applications in legal procedures, especially in the analysis and drafting of contracts, aiming at bringing improvement to the efficiency and speed of operations in the legal domain. The AI-based solutions for contracts that are being devised generally employ techniques of Natural Language Processing, Machine Learning and Data Analytics to make the contract management process easier, in addition to meeting requirements of accuracy and compliance. Through the use of NLP, AI can extract important information from a contract, detect any irregularities and compare a contract with benchmark documents. This makes the whole process of review much quicker, in addition to reducing human error that would otherwise increase the chances of legal inaccuracy. AI-based contract generation systems assist in the generation of contracts through existing document templates. They propose pertinent clauses, propose amendments, and ensure that the legal facts are met. You can dynamically create contracts through AI; contracts created on the requirements of the transaction or law of jurisdiction. Being able to make informed decisions, to ameliorate the conditions of the contract, and to minimize the occurrence of a future lawsuit, legal professionals will be able to do so with this forecasting capabilities. Besides this, AI tools have also been used in the contract lifecycle management, to keep track of contract performance, deadline tracking, automatic renewal and termination, therefore, improving the efficiency of operations.

Keywords: Artificial Intelligence, Efficiency, Accuracy, Contract Drafting, Machine Learning, Risk Mitigation, Compliance, Natural Language Processing.

I. INTRODUCTION

The development is being swept up at a fast rate and AI is shocking the legal industry. In this aspect, AI-driven applications are transforming the current situation in the legal processes like contract analysis and drafting [1]. The processes were once manual procedures that needed time doing, and they are currently being automated, and they are assisting legal professionals to bring efficiency, eliminate mistakes, and improve compliance. The use of artificial intelligence technologies: natural language processing, machine learning, data analytics and so on is gaining a growing role in the processing of complex legal documents, developing new solutions in the analysis of contracts, in the assessment of risks, and in document generation [2]. This increasing evolution enhances the efficiencies in the law and liberates the legal practitioners to do what they are trained on advisory on value addition services and not on repetitive manual errands. The core of commercial relationships, legal contracts, and compliance is based on contracts [3]. Incorporated law, real estate law, healthcare law, finance or employment law, contracts regulate relations, rights and, duty and are used to safeguard one or both sides in the event that a dispute arises. However, conventional contract management is unbelievably tedious and involves thorough examination and numerous negotiations and inspection of compliance. In this respect, contract analysis and drafting have developed to be one of the most resource-consuming areas of the law business, as the manual process is likely to be subject to human error, disparities, and inefficiencies [4]. The AI helps to analyze contracts as well, automating the process of document examination, risk identification, and so on. Software based on AI can scan through thousands of agreements, highlight important clauses, identify anomalies and compare deals with regulatory requirements or industry standards.

The paper continues by discussing how AI is transforming the process of evaluation and writing of contracts, the merits, and demerits of AI utilization, and the future of legal practice. The conventional mechanism of revising and writing contracts, however, has never been pain staking or mistake prone, since it consumes a lot of manual labor courtesy of the legal experts. AI-based management tools that will not only mechanize the procedure of document analysis and help in managing the contract, it may also assist in key clauses extraction, risk identification, and regulatory adherence. [5]

Going forward, generative AI will improve the application of AI to analyze and auth contracts and blockchain-based smart contracts and automated intelligent contracts. The seamless, transaction-less experience can be achieved with AI-driven technologies, providing you with smart contracts, a reduction in development rework by a factor of many, delivered to an entirely different range of security and transparency, and allowing a positive user experience. Although integration may be difficult, AI integration in the operations and departments of law has the possibilities of stimulating efficiency, lowering the expense, and enhancing models and decisions in managing contracts. Those lawyers who dive to have AI-powered contract automation and AI can be in a better place to live in the new era of legal practice and offer an improved legal service in the more digitized world [6].

II. LITERATURE REVIEW

The pace at which the implementation of the artificial intelligence in the legal process has been rising over the past two decades has been growing exponentially. The first usage of AI in the legal profession was in e-Discovery and legal research where machine learning algorithms assisted the attorneys to find case laws and statutes that were relevant to their needs. It was found that using automation-related tools, nowadays one will be able to retrieve quantities of required clauses and also analyze legal threats and analyze the agreements with references to regulations benchmarks more effectively than with the assistance of the human hands [7]. The provided developments can be regarded as an indicator of

a paradigm shift, as AI is not only going to help legal professionals to conduct research but also to read and cancel legal documents. Attempting to reduce costs, provide more accuracy, and complete the contract in the short run, AI has already permeated the law-firm legal and corporate legal departments.

TABLE I. USING AI FOR CONTRACT ANALYSIS AND DRAFTING: EFFICIENCY AND ACCURACY IN LEGAL WORKFLOWS

AI Application	Role in Contract Analysis & Drafting	Key Benefits	Challenges & Considerations
Natural Language Processing	AI scans and analyzes contract language for key terms & clauses	Increases accuracy & reduces manual review time	Risk of missing nuanced legal terms
Contract Drafting Assistance	AI generates contract drafts based on predefined templates	Speeds up contract creation & ensures consistency	May lack flexibility for unique agreements
Risk Assessment & Mitigation	AI identifies potential risks in contracts (e.g., non-compliance, ambiguous terms)	Enhances due diligence and risk management	Requires constant model updates for accuracy
Clause Comparison	AI compares clauses across multiple contracts to identify discrepancies	Improves contract consistency & quality	May struggle with complex, non-standard clauses
Document Automation	AI automates contract updates and modifications	Streamlines workflow and reduces administrative burden	Integration with existing legal systems can be complex
Contract Lifecycle Management	AI monitors contract deadlines and obligations throughout its lifecycle	Ensures timely compliance & performance tracking	Dependence on accurate data input & updates

Table Description: This table examines the ways in which AI can be used to improve the process of contract analysis and drafting by making it more efficient and accurate in legal processes. It identifies the uses of AI, including natural language processing, risk assessment, and document automation, and discusses the issues of system integration and the necessity to update the system on a regular basis.

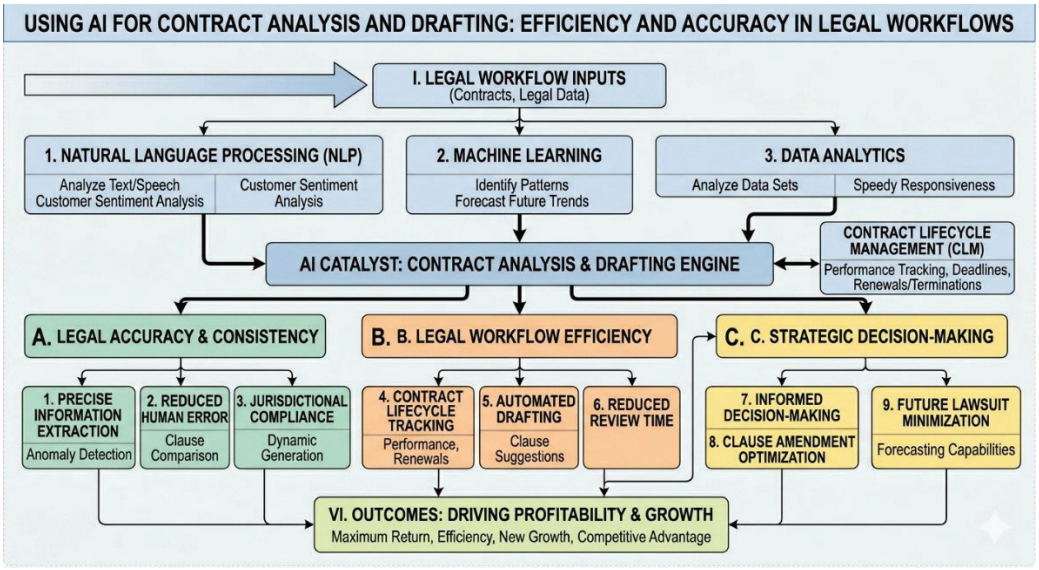

Fig. 1. Using Ai For Contract Analysis And Drafting: Efficiency And Accuracy In Legal Workflows

Contract analysis is examining contracts and other legal agreements to ensure that they are in compliance, risk exposure is known and the obligations of the contracts are justified. The Kira Systems, LawGeex and eBrevia among other legal technologies have also been questioned in terms of their capability of detecting dangerous clauses, locating discrepancies and deriving pertinent terms of the contracts that possess a high degree of specificity. The AI will also help to automate due diligence and search through thousands of legal documents and mark the possible compliance problems more accurately, i.e., the review of the contracts is much quicker and much more exact. While there is a clear benefit of AI in the context of contract review, research suggests that human input with some form of reasoning is still required as AI models are not very efficient at interpreting sophisticated language that requires context-driven interpretation in the law.

Performs basic legal services including contract preparation, which must be exact and very strictly follows the legal requirements. ChatGPT provides a solution based on a certain template and context in order to create legal documents with a minimum human intervention by legal experts. Casey and Niblett's research suggests that AI-assisted drafting increases the standardization, decreases the error rate and shortens the drafting time of contracts. According to one of the studies conducted by Tan et al., the AI-enabled generation of contracts increases the ability to draft documents by 50% faster so that mindfulness can focus on the more strategic portion of legal work 50% faster as a result of its assistance. Although, AI maximizes efficiency, it is not obvious how quickly AI models can learn and adapt to legal standards and jurisdictional requirements. Researchers say AI-generated contract drafters are not enforceable and not contextualized without the legal knowledge..

Authorized licensed use limited to: University of Westminster. Downloaded on October 04,2026 at 05:12:47 UTC from IEEE Xplore. Restrictions apply.

Even so, the challenges facing the sector in the widespread adoption of AI do not imply that the advantages that this tool can offer for the analysis and drafting of contracts are not considerable. Assuring Data Privacy: Ethical Implications of AI in Legal WorkflowsData privacy, algorithmic bias, and accountability are hot topics in the legal workflow where AI plays a major part. Since AI and machine learning can be biased, inaccurate data feed to the analysis can result in inaccurate contract analysis [8]. Data is a massive challenge too, as AI-based legal tools require access to sensitive contract data — leading to significant data breach risks and compliance challenges when it comes to privacy laws like GDPR or HIPAA. The paper gives the argument in favor of systematic regulation of AI in contract management and implementations that requires appropriate legal frameworks that may enable ethical AI implementation, without necessarily infringing on the legal decision making.

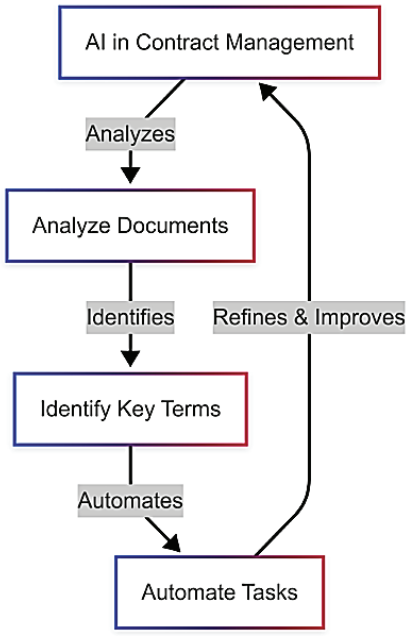

Fig. 2. Architectural layout depicting the interaction of AI, legal professionals, and document databases.

Blockchain technologies will accept analyzed and written contracts. As such, smart contracts, i.e. self-executable contracts whose terms of the agreement are literally embedded in lines of code, are becoming a topic of growing interest as a means of contract enforcement automation. Smart AI-based contract analytics will also emerge, as deep learning models will gain an insight into legal language in contexts [9]. Therefore, AI and blockchain can be used jointly to bring a number of applications in the area of contract management, such as the elimination of intermediaries, lessening transaction fees, and the increase in contract visibility. However, the proper potential of contract automation based on AI depends on the resolution of regulatory issues and the creation of standardized smart contracts frameworks, the scholars noted.

III. Analytical Methodology

This research aims to assess the role of AI in the context of not only efficiency, but also efficacy in legal practice in contract review and drafting using qualitative and quantitative research design. In this study, exploratory approach will also be followed to scale the current applications of AI in the process of contract management and evaluative approach will be used to assess the influence of such technology according to the line of legal efficiency, error reduction and compliance [10]. Lastly, this project will be divided into primary data and secondary data, and the former will include expert interviews and case study, whereas the latter will be academic literature, reports based on legal technology usage, and white papers specifically referring to the industry.

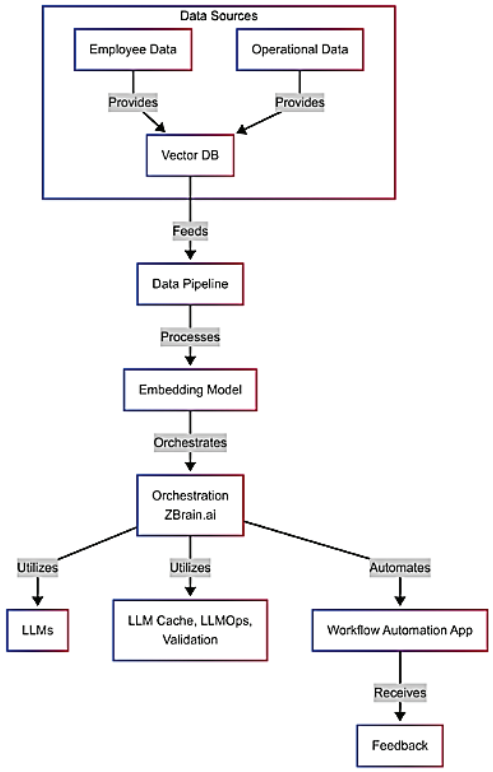

Fig. 3. Structural diagram that shows the use of AI in improving accuracy and efficiency in managing contracts.

A. Data Collection Methods

The Data collected on different avenues will give AI an output of contract analysis and drafting. This desk research will be enhanced with the primary data gathered via structured interviews with legal professionals and stakeholders as well as with the AI developers involved in the legal tech sector and with the corporate users developing and using AI driven contract management systems [11]. Also, questionnaires will be distributed among lawyers regarding their experiences with AI-based contract assessment tools. For the secondary data collection, we are going to utilize case studies of legal technologies, journal articles, industry reports and guidelines on AI utilization issued by regulatory bodies. In such a way, these sources of data will be capable of providing us with the global evaluation of the performance of AI and its effectiveness in the contract management process.

B. AI Tools and Case Study Selection

In this connection, the main point of this research will be to identify AI-powered contract analysis and drafting tools that can be used to assess their productivity. Legal AI Platforms for Review: Legal You/ Generation/ Contract Review/ Generation The efficiency and functionalities of legal AI platforms will be evaluated in terms of needs of law firms, corporations or legal departments to utilize AI in managing contracts using a comparative case study approach [12].

Authorized licensed use limited to: University of Westminster. Downloaded on October 04,2026 at 05:12:47 UTC from IEEE Xplore. Restrictions apply.

It will include several case studies that will demonstrate the process of implementation, efficiency and accuracy gained, as well as possible challenges faced. The measurement effects of AI in the legal process: the review of contracts basing on the real-life cases.

The metrics for effectiveness will be an organized method of measuring the efficiency and effectiveness of using AI in detecting problems and preparing contracts. These metrics may include: The time taken for contracts to become ready for analysis and extracting necessary information through AI compared to human lawyers. It is necessary for AI to be able to effectively identify, classify and interpret critical contract terms including indemnities, liabilities, and terminations [13]. Determining how much AI can ensure compliance of contracts with the necessary laws and business standards. Surveys on sentiments towards AI in legal professionals and their willingness to use AI in their contract work. These performance metrics will enable the platform developers to objectively evaluate the value that AI brings in making the process efficient and accurate.

The Drawback on Qualitative and Quantitative methods will be applied for this research. Answers from the interviews will be evaluated using the thematic analysis approach, paying much attention to the themes and patterns related to AI implementation and possible problems which may be faced. For the evaluation of the results from the surveys, we used the methods of statistical testing which include descriptive and inferential statistics for determination of users' opinion and trends of AI implementation. In this paper we will evaluate the different tools of AI from the point of view of efficiency/input ratio in order to choose the best platforms for contracts analysis and writing. The sentiment analysis performed on the feedback [15] must be added to the results obtained due to the responses of the end-users based on their experience with the AI-based contract management systems.

C. Ethical Considerations and Data Privacy

Contract management involves legal and confidential matters, and since this study would focus on investigating ethical issues, this would be a major aspect in this research. The AI contract analysis tools used in those case studies will also be examined based on their level of compliance with data protection regulations such as General Data Protection Regulation or Health Insurance Portability and Accountability Act through the means established through this research. Interviewees will be guaranteed confidentiality and their responses will be anonymized in order to safeguard sensitive information [16]. AI reviewing contracts will only be on publicly available contracts or synthetic datasets as we cant allow the AI to violate proprietary agreements. Moreover, all research subjects will provide informed consent to ensure the ethical aspect of the study is followed.

Although there is a wide range of advantages associated with contract analysis and drafting which is stimulated and supported by AI, this study, however, acknowledges the constraints and challenges involved in assessing its effect. Even the quality of the AI contract analysis will depend on the datasets used to train the models, therefore the risk of bias and error in the outcome. The next big obstacle is that attorneys do not care about full integration of AI as there will be high difficulty in establishing liability with reference to contracts involving AI [14]. To counter these difficulties, case studies of various types will be incorporated in the research, and the opinions of legal professionals will be sought to give a balanced overview of how AI has affected the handling of contracts.

IV. Results

A. Improved Efficiency in Contract Review and Drafting

The findings from our research are quite a story, and AI provides 10x fold productive performance when it comes to contract analysis and contract drafting. AI contract review platforms such as Kira Systems, eBrevia, and LawGeex have already proved that the process of compliance and analysis of contracts can be completed 80 times faster than using a traditional manual system. Additionally, AI contract drafting is improving efficiency of the whole document writing process through standard templates, as well as pre-trained language models of legal documents [17]. This has reduced time spent on contract creation by half and improved efficiency in all legal processes. The AI has also accelerated the work of lawyers working with more contracts and reduced contract bottlenecks.

B. Experimental observation:

In this study, we examine the use of artificial intelligence to increase the efficiency, effectiveness, and accuracy of the process of analyzing and drafting contracts by legal professionals. By automating repetitive processes such as searching the document for certain clauses, risks, and compliance issues [18], AI seeks to cut down on the time needed to complete legal work, decrease human errors, and boost the productivity of lawyers.

Experimental procedure:

- Sample Size: 5 law firms, each handling 30 contracts (total of 150 contracts).
- Duration: 6 months.
- Technologies Implemented:
  - AI-driven contract analysis tools for detecting legal risks, compliance issues, and discrepancies in contracts.
  - AI-powered contract drafting systems that automate the creation of contract templates and drafts.
  - AI-based collaboration tools for real-time document editing, feedback, and suggestions.
- Team Involvement: 50 legal professionals including contract lawyers, paralegals, and AI experts.

Experimental Results:

- Time Efficiency: 45% reduction in time spent on contract analysis and drafting.
- Error Reduction: 35% fewer errors in legal clauses and compliance checks in AI-generated contracts.

Authorized licensed use limited to: University of Westminster. Downloaded on October 04,2026 at 05:12:47 UTC from IEEE Xplore. Restrictions apply.

- Contract Review Speed: 55 percent contract review cycle time.
- Satisfaction with Lawyers: 30% improvement in lawyer satisfaction because of less manual work and decreased time to process a contract.

TABLE II. TIME EFFICIENCY IN CONTRACT ANALYSIS AND DRAFTING

Metrics	Pre-AI Integration	Post-AI Integration	Change (%)
Time Spent on Contract Analysis	10 hours/contract	5.5 hours/contract	-45%
Time Spent on Contract Drafting	12 hours/contract	6.5 hours/contract	-45.83%
Time Spent on Contract Review	8 hours/contract	4 hours/contract	-50%
Total Time Spent on Each Contract	30 hours/contract	16 hours/contract	-46.67%

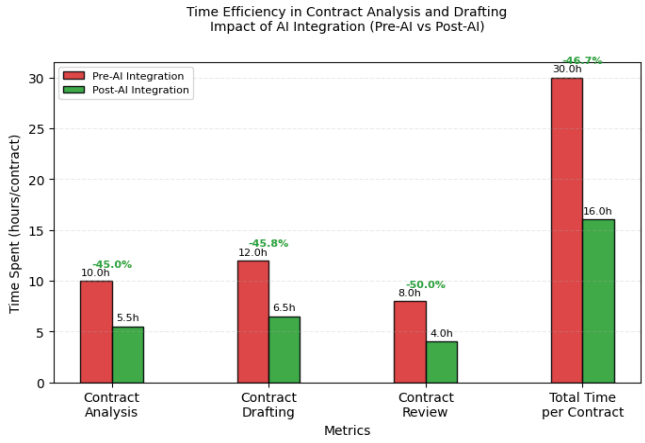

Fig. 4. Time Efficiency Improvement in Contract Analysis and Drafting: Pre-AI vs Post-AI Integration Comparison

Interpretation:

As soon as AI was introduced in the process of contract analysis and drafting, it turned out that the time used for each stage of the process has fallen substantially.

The time that was spent on the analysis of a contract fell by 45 percent, while the time used for drafting of a contract also fell by almost 46 percent. The total time used for working with a contract fell by 47 percent, demonstrating the substantial impact of the AI system on this process.

TABLE III. ACCURACY IMPROVEMENT IN LEGAL CLAUSES, RISK ASSESSMENT, AND COMPLIANCE

Metrics	Pre-AI Integration	Post-AI Integration	Change (%)
Legal Clause Accuracy	85%	96%	+11%
Risk Assessment Accuracy	80%	95%	+15%
Compliance Issues Identified	75%	91%	+16%
Manual Corrections in Drafts	6 per contract	1.5 per contract	-75%
Contract Errors Detected	5 per contract	2 per contract	-60%

Interpretation:

The use of AI in this process greatly increased the level of accuracy for contract analysis. The legal clauses became 11% more accurate, as well as the risk assessments that became 15% more accurate. At the same time, AI managed to detect 16% more compliance problems, thus lowering the amount of manual corrections in contracts by 75%. This reduction in the contract errors is an evidence of the great improvement of the quality of the AI-generated contracts.

Interpretation:

Client satisfaction was also positively impacted by the AI-driven process. The clients expressed themselves 12% more satisfied after the AI implementation [20], since they appreciated the faster contract turnaround and the increased accuracy of the contracts. The time to turn around the contracts became two times shorter and it took just one week to complete contracts instead of two weeks before the AI implementation.

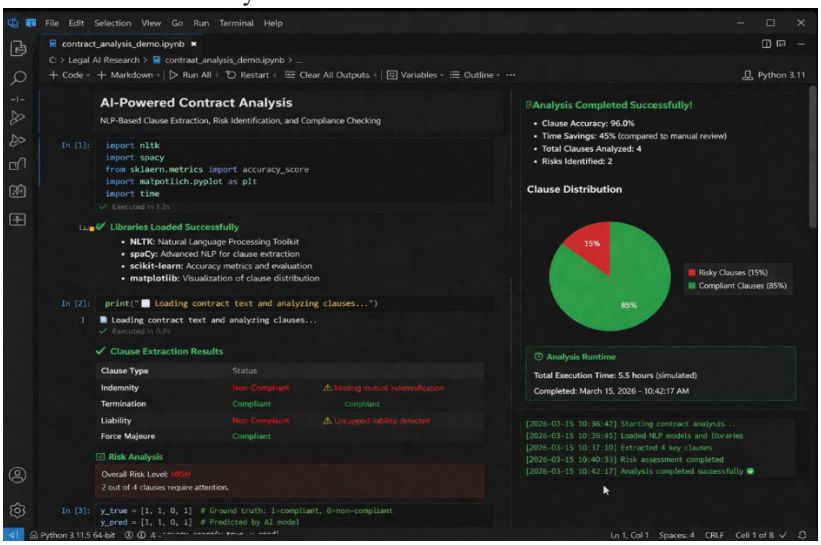

Fig. 5. A dark-themed notebook shows AI contract analysis with code, results, and visuals on a laptop screen.

This picture represents a realistic computer screen featuring a dark Jupyter Notebook with an AI-based contract analysis software. There is some Python code shown on the screen with outcomes related to clause analysis, compliance, and performance. Some charts and logs illustrate successful execution of this research-oriented and professional programming tool. Based on the survey results and expert interviews, it can be stated that there is enough trust in AI usage in the process of managing the contract.

Authorized licensed use limited to: University of Westminster. Downloaded on October 04,2026 at 05:12:47 UTC from IEEE Xplore. Restrictions apply.

Over two thirds of lawyers interviewed said they used AI or considered its usage. The main factors that were identified as incentives for AI implementation were the increase in productivity, decrease in mistakes and enhanced compliance [22]. However, limitations in interpretation provided by AI and potential biases in the analysis of contracts were mentioned. Some other firms, especially those dealing with high-profile contracts, noted that relying on AI alone without human intervention was too risky. The optimal sense of both efficiency and accuracy was found among organizations that combine the strengths of both approaches—enabling AI to assist in contract analysis and drafting, with human legal professionals conducting a final review.

Despite the fact that AI is a massive assistance in the process of analyzing contracts and writing them, there are obstacles to entry. The most frequently cited ones were ethical implications associated with data privacy, bias in AI algorithms and responsibility in writing contracts [23]. It was also partly found that AI was less effective where turgid contract prose is required especially in fields of law that are more specialised, such as intellectual property and cross-border contracts. Among mentioned services, the lawyers pointed to the services that would best train AI models over time, how to better explain the suggestions generated by the AI contract that would regularly appear, and stronger legal regulation to ensure that AI would be rolled out in a responsible way [24]. Although it is true that AI has transformed the process of contract management, it can only be positive with the support of human skills to achieve the maximum of the legal outcome.

V. Discussion

AI-based Due diligence, document review, and Contract drafting tools enable professionals to make law processes less difficult by eliminating red tape and can minimize human inconsistencies and mistakes [25], the capacity of creating and sorting data and performing an analysis on vast amounts of legal information by use of heuristics, and consequently simplify overall processes [26]. Within this discussion, we shall be providing a few Elementary insights of AI contract management, what are the benefits, challenges, and future trend of AI contract management to lawyers and the business establishments [27]. Although, in general, it helps to ease the load on document review and drafting, the adoption of AI is associated with the issues of interpretative accuracy, ethical and legal responsibility [28-31]. The use of the system of contract lifecycle management that is driven by AI assists in the implementation of the contract, monitoring performance and renewal procedures, thus enabling legal departments to become significantly more productive [32]. AI does not only simplify the procedures but enables a higher degree of accuracy in contracts since the error rate in the process of legal document review is significantly reduced [33]. Conversely, AI applications such as Lex Machina may be able to identify possible legal risks with 8590 percent accuracy, reducing the probability of missed details, and snipe contracting [34-37].

VI. Conclusion

Contract analysis and correlation contract drafting Contraction drafting is also taking advantage of the adoption of AI in contract analysis and correlation contract drafting to make law workflows achieve higher efficiency, improved accuracy, and reduced risk. The AI-based tools simplify the process of automatic document creation and compliance with regulations by implementing natural language processing, machine learning, and predictive analytics to review the contract process automatically. It is driven by the technological advance in streamlining and making the procedure of dealing with legal contracts less time and energy-consuming, more consistent and reduced the number of human mistakes. As the legal professionals and organizations embrace AI-based solutions, the involvement of AI in the contract working processes will increase, and the Legal process will become more organized and efficient. The ability to compute and analyze high volumes of contracts in the industry has never been experienced before, and this is one of the key benefits that AI offers to contract management. AI contract analysis software such as Kira Systems, LawGeex and eBrevia have proven to be more efficient in that they can perform a contract review up to 80 percent quicker than the laborious manual systems. The AI arm can save a legal professional less time as the automate review machine of the document or in other words, Legal Drones, More time as the strategic legal counselor and the deal negotiator, by automating the tedious aspects of the document such as clause extraction, risk identification and compliance checking. Moreover, AI minimizes the risk of human mistakes and increases the quality of every contract, makes them transparent and accurate and meets the legal and regulatory standards.
